

HadISST - the Met Office Hadley Centre sea ice and SST data set - current version and future plans

Nick RAYNER

Hadley Centre for Climate Change, Met Office, Exeter, UK

This overview presentation will discuss the HadISST analysis. The current version, HadISST1, is a very widely used globally complete analysis of SST and sea ice on monthly resolution from 1870 onwards. We have been planning the development of HadISST2, which should improve upon this in several ways. Here we will present and motivate our plans, giving an opportunity to then feed your views back into those plans in the later breakout sessions.
